a General Interpretive Guidelines

This test uses an equilibrium dialysis method.

Free T4 by equilibrium dialysis is not affected by autoantibodies (in contrast to total T4), and free T4 is less frequently affected by non-thyroidal illness ("euthyroid sick syndrome") compared to total T4. A low free T4 is considerably more specific for hypoT than total T4, however non-thyroidal illness or drug therapy may depress free T4 in some

Causes of low free T4: * hypoT

* non-thyroidal illness ("euthyroid sick syndrome")

* hyperadrenocorticism * drug therapy (including glucocorticoids and phenobarbital) * note that Greyhounds have a lower reference range than most other dog breeds. TSH shows less breed variation.

Suspected primary hypoT:
* further diagnostic options include endogenous TSH
* concurrently low free T4 and high TSH values indicate a very high probability of hypoT

The above test was performed by IDEXX Reference Laboratories, West Sacramento, USA.

b General Interpretive Guidelines

Endogenous TSH alone is not suitable for assessing thyroid status as there is considerable overlap between normal dogs, hypothyroid dogs and euthyroid dogs with concurrent non-thyroidal illness.

However endogenous TSH is valuable when combined with free T4: * concurrently elevated TSH and low free T4 values indicate a very high probability of primary hypothyroidism.
